Project Title: Enhancing Paytm's Bill Payment Experience

Problem-Solution Fit

Problem Statement:
Frequent Paytm users face confusion and friction when managing and tracking multiple utility bill payments (e.g., electricity, water, gas, broadband) across different due dates, providers, and accounts. There is no single point of visibility, leading to missed payments and reduced app satisfaction.

Why It Matters:

- Missed or late bill payments often result in penalties or even temporary service disconnections.
- Users must manually remember each due date or set reminders externally, leading to frustration.
- Other apps (like PhonePe and Google Pay) offer better reminder integrations, making Paytm less competitive.
- A unified experience would reduce cognitive load and enhance user retention.

Solution Concept:
Introduce a centralized Bill Management Hub within Paytm that:

- Automatically imports bills using linked account information.
- Shows categorized bills (e.g., electricity, water, gas) with due dates and payment status (paid/pending).
- Sends timely notifications via push/SMS for upcoming and overdue payments.

Opportunity Sizing (Bottom-Up)

Approach Used: Bottom-Up Sizing Method

Target Audience:
Paytm users who actively use bill payment features.

Bottom-Up Assumptions and Estimates:

- Total Monthly Active Users (MAUs) on Paytm: 100 million
- Percentage of users paying bills via Paytm: 35%
- Number of bill-paying users = 100M × 35% = 35 million
- Average number of bills paid per user per month = 3
- Average revenue earned per bill transaction = ₹50

Bottom-Up Opportunity Calculation:

- Total monthly transactions = 35M users × 3 bills = 105 million bills
- Monthly revenue opportunity = 105M × ₹50 = ₹5.25 billion
- Annual revenue potential = ₹5.25B × 12 = ₹63 billion/year

Top-Down Sizing Definition (for reference):

- **TAM (Total Addressable Market):** The entire digital utility bill payments market in India, which includes all digital wallets, banks, and apps offering this service.
- **SAM (Serviceable Available Market):** Paytm's addressable market within digital wallets, based on its market share in the digital payments sector.
- **SOM (Serviceable Obtainable Market):** The realistic share Paytm can capture with enhanced features—estimated at 35% of its MAUs engaging with bill payments.

Interpretation:
This combination of sizing methods highlights a ₹63 billion/year revenue opportunity through Paytm bill payments alone. Strategic improvements could expand its SOM and strengthen its position in the SAM and TAM.

Metric	**Value**
MAUs on Paytm	100 million
% using bill payments	35%
Bill-paying users	35 million
Avg. bills/user/month	3
Revenue per bill	₹50
Total monthly revenue	₹5.25 billion
Total annual revenue (approx)	₹63 billion

Prioritization Using RICE

Feature Ideas:

1. **Unified Bill Dashboard** - Centralized view of all pending and paid bills.
2. **Smart Reminders & Alerts** - Customizable, proactive notifications.
3. **Autopay with Threshold Controls** - Auto-deductions with user-set limits.
4. **Bill Split & Sharing** - Sharing bills with family/roommates.

RICE Score Table:

Feature	Reach	Impact	Confidence	Effort	RICE Score
Unified Dashboard	30M	8	90%	5	432
Smart Reminders	25M	6	80%	4	300
Autopay Controls	15M	5	70%	6	175
Bill Split	10M	6	60%	5	144

Conclusion:
Prioritize features as:

1. Unified Dashboard
2. Smart Reminders
3. Autopay
4. Bill Split

MoSCoW Framework

Must Have	Should Have	Could Have	Won't Have
Unified Dashboard	Smart Reminders	Bill Split	Gamification badges
Basic bill summary UI	Autopay with limits	Voice reminders	Crypto bill pay

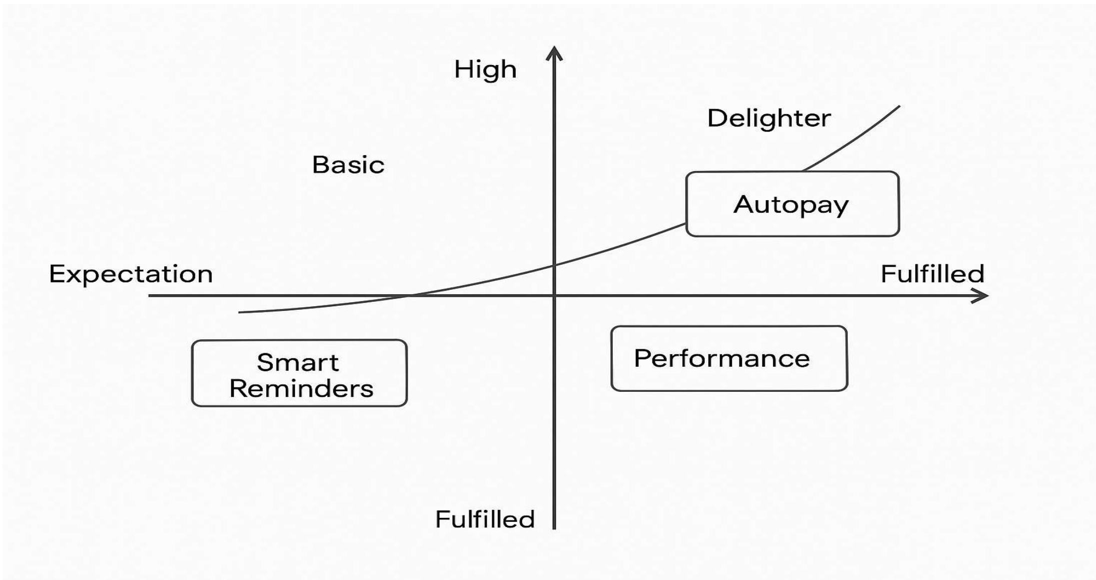
Exclusions Rationale:

- Features like gamification or crypto support are interesting but don't address the core user problem.
- They can be revisited after validating the core MVP.

Kano Framework Classification

Feature	Kano Category	Explanation
Unified Dashboard	Performance	The more useful and organized the dashboard, the higher the user satisfaction.
Smart Reminders	Basic	Users expect reminders by default to prevent missed payments.

Feature	Kano Category	Explanation
Autopay	Delighter	Automatically paying bills is a surprise convenience and drives long-term loyalty.



Analysis:
These features span across categories of the Kano model, ensuring a well-rounded Minimum Viable Product (MVP).

- The "Smart Reminders" fall under the Basic category, which are fundamental expectations of users. Their absence results in dissatisfaction, but their presence only brings neutral satisfaction.
- The "Unified Dashboard" represents a Performance feature. As its functionality improves, so does user satisfaction proportionally. It's essential for delivering tangible value.
- The "Autopay" feature is a Delighter—users may not expect it initially, but once experienced, it significantly boosts satisfaction and brand loyalty.

This balance of features covers the core needs, improves usability, and includes a surprise element, increasing the likelihood of adoption, satisfaction, and long-term retention.

MVP Definition:

The **Minimum Viable Product (MVP)** for Paytm's bill management is simply the most basic version of the new feature that still helps users a lot. It includes a single **Bill Dashboard** to see all your bills in one place and **Smart Reminders** to help you pay on time. This MVP aims to quickly check if people find it useful to have all their bills together and get reminders, helping Paytm learn and improve without building the whole thing at once.

Key MVP Features:

- Unified Bill Dashboard
- Smart Reminders via push and SMS notifications

Core Value Proposition:

- Simplifies life by aggregating bills in one place
- Prevents missed payments with automated alerts

Testing Plan:

- Build interactive prototype (e.g., using Figma or in-app sandbox)
- Deploy to a closed group of Paytm Power Users
- Run A/B tests comparing current vs. new experience

Success Insights Sought:

- Daily/weekly engagement with the dashboard
- Opt-in rate for reminders
- Drop in missed/late payments
- Feedback on ease of navigation

One Metric That Matters (OMTM)

Primary Metric:
"Percentage of users enabling and acting on bill reminders (monthly)"

Why It Matters:

- High engagement with reminders proves the feature solves the core problem.
- Tracks user intent (enabling) and behavior (acting on it).
- Correlates with bill payment volume and retention.

Secondary Metrics:

- Number of bills paid via dashboard
- Reminder-to-payment conversion rate
- Monthly active users using the bill management feature
